

3M[™] Speedglas[™] Welding Helmet 9100XXi FX Air

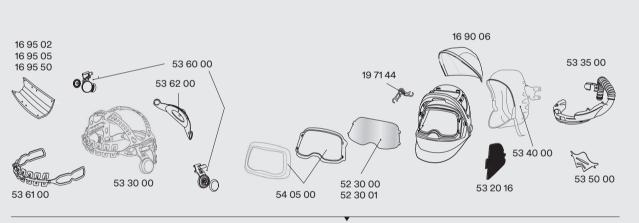

To optimise the effective lifetime of your welding equipment and avoid the additional cost of replacement, regular maintenance is important. Replace all damaged parts immediately to ensure correct levels of protection. Below is a helpful overview; always read and follow User Instructions.

Before use

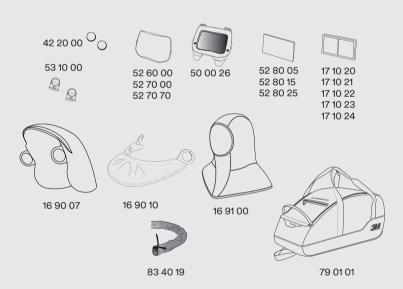

- ① Helmet and head harness. Inspect for cracks or any damaged parts. Replace if needed.
- 2 Cover lenses and visor. To provide the best possible vision, they should be clean and without scratches.
- ③ Face seal. If the face seal is damaged there is a great risk that contaminated air will get inside the helmet. Verify it's in position and free from splits and tears.
- **(4)** Welding filter. Ensure that the low battery indicator is not flashing and check that the sensors are clean and uncovered.
- (5) Breathing tube. Confirm that the tube is not damaged or leaking any air. To extend the life of the breathing tube, use a tube cover or a heavyduty breathing tube.

After use

- ① **Clean the helmet.** Wipe with a moist tissue or cloth, both inside and outside the helmet. If you suspect that the inside of the breathing tube is dirty, it must be changed. DO NOT rinse, immerse in water or clean with solvents.
- ② Face seal and sweatband. Remove for additional cleaning as needed and replace if they have splits or tears or whenever they become unhygienic.
- ③ Cover lenses and visor. Clean with a soft cloth and replace if any pits or scratches occur.
- ④ Breathing tube. Replace if damaged, deformed or leaking any air.
- 5 Storage. Store the helmet in a dry, clean area away from direct sunlight, high temperatures and solvents.
